

DiscountMate Power BI Dashboard Review

Prepared by: Senushi Ruwanya Kalawitigoda

Workstream: DA 02 Insight Surfacing

Task: DA 02 T1 Audit Existing Power BI Dashboard

Reporting period: Week 5, T2 2026

1. What I reviewed

I reviewed the two pages available in the Power BI Test Dashboard from last trimester. I wanted to understand what was already there before our team starts adding new views and features. I looked at the filters, charts, tables, visible calculations and the type of information shown to users.

My overall impression is that the existing dashboard gives us a useful base. We do not need to throw away the previous work. We can keep the parts that already work and improve the dashboard as our requirements become clearer.

2. Dashboard pages

The shared Test Dashboard currently contains these two pages:

- **Product Price Analysis:** compares product prices between retailers and shows price changes over time.
- **Category Specials:** lists products that are on special and allows users to narrow the list using filters.

The PBIX metadata also contains references to Product Comparison and Product Search. These pages are not visible in the current published dashboard and have not been verified in Power BI Desktop, so they are outside the confirmed active scope of this audit.

3. Product Price Analysis

This page is useful for checking how the price of one product has changed and comparing the available retailers.

Area	What is currently included	What I noticed
Filters	Category and product selection, with a date range on the chart.	The filters are simple and make the page easy to explore.
Visuals	Product price by date and retailer, product image and retailer comparison.	The history chart is useful, but the current best option could be more prominent.
Price metrics	Lowest, highest and average price, plus maximum discount.	These metrics provide useful context beyond the current price.
Discount metrics	Average, maximum and total discounted days, number of discount events and percentage on special.	The calculations should be explained in plain language for customers.

4. Category Specials

This page presents discounted products in a detailed table and lets the user narrow the results by category and discount range.

Area	What is currently included	What I noticed
Filters	Category, discount range and an option to display only the lowest prices.	The filters support quick deal discovery and should be retained.
Product fields	Brand, product name, pack or unit and retailer.	Useful detail, although long names make the table dense.
Promotion fields	Current price, discount percentage, date on special, lowest price and an indicator for the best price.	The strongest deals should be highlighted more clearly.

5. Data source and model review

Files reviewed.

Along with the published dashboard, I reviewed Test_Dashboard.pbix, DAX_Columns.xlsx, DAX_Queries.xlsx and the Power BI MongoDB Connection Guide provided in the DiscountMate Teams channel.

Connection and refresh.

The dashboard connects to MongoDB Atlas through the Atlas SQL connector. The connection guide recommends Import mode with a scheduled or overnight refresh because the dashboard does not require real time updates. DirectQuery is available as an alternative but requires the supported ODBC setup.

Main model data.

The model uses product pricing, product, store, product category, date and discount range data. Important fields include product_id, product_code, store_chain, store_name, date, price, best_price, unit_price, best_unit_price, is_on_special, product details and category details.

6. DAX and transformation review

The DAX exports contain 210 model column entries, including 112 nonblank calculated column expressions, and 35 measures. I checked the main calculations used by the existing pages rather than only recording the values visible on screen.

- **Price measures:** minimum, maximum and average price, product savings, discount amount and price change percentage.
- **Promotion measures:** percentage of days on special, average, maximum and total days on special, discount event count and discount range filtering.
- **Display logic:** price direction arrows, conditional colours and indicators used to make price changes and best values easier to read.
- **Data preparation:** retailer name standardisation, product ID cleaning, numeric unit price conversion, previous price and date calculations, discount percentage, days on special, HTML cleaning and product image fallback logic.

7. Main findings and recommendations

Both pages are a good starting point. From this review, these are the improvements I think would be most useful:

- **Customer view:** focus on prices, specials, retailer comparisons, potential savings and clear recommendations.

- **Admin or stakeholder view:** show price trends, retailer performance, popular products, data quality, coverage and refresh status.
- **Behavioural insights:** add popular or frequently compared products when Feature 1 provides the required GA4 and persona outputs.
- **Clarity:** highlight the cheapest retailer and strongest deal instead of requiring users to interpret several tables.
- **Transparency:** display the latest data refresh time and explain how savings and discount measures are calculated.
- **Consistency:** align colours, fonts and cards with the DiscountMate Product Comparison page before developing the embedded insights.

8. My conclusion

The Test Dashboard already provides useful price, retailer and promotion information, so I think it makes sense to use it as our starting point. We can add new pages and improve the current visuals instead of rebuilding everything without a reason.

The next step is to use this review when defining the stakeholder views and dashboard requirements. The team should reuse the existing model and calculations where they are suitable, then add only the new fields and measures required for the approved customer and stakeholder views.

9. Task completion check

Planner criterion	Evidence in this report	Status
Existing dashboard reviewed	Both available T1 Test Dashboard pages were reviewed.	Complete
Current visuals documented	Filters, charts, tables, product fields and promotion metrics are recorded in Sections 3 and 4.	Complete
Data sources identified	MongoDB Atlas connection, refresh approach and main model data are documented in Section 5.	Complete
DAX layer reviewed	Existing calculated columns, measures and transformation logic are reviewed in Section 6.	Complete
Findings shared with team	This report is ready to attach to DA 02 T1 and share in the DA/ML team channel.	Ready
