

DA-02-T2 – Stakeholder Dashboard Views

Final Requirements Proposal

1. Purpose

This document outlines the proposed views for the DiscountMate stakeholders' dashboards. The current customer-facing dashboard has been used as a baseline from which other stakeholder views have been developed depending on the information needed by the stakeholders.

These dashboards are designed to eliminate repetition of the same information on all dashboards. This is because each of the dashboards focuses on a specific stakeholder and their responsibilities.

2. Stakeholder Groups

The following stakeholder groups were identified:

1. **Customer**
2. **Admin**
3. **Mentor**
4. **Developer**

3. Stakeholder Dashboard Requirements

Stakeholder	Proposed Dashboard	Purpose	Key Information
Customer	Product Discovery & Price Comparison	Help customers discover products and make better purchasing decisions	Product search, categories, product details, prices across stores, savings/value indicators, filters, favourites and product actions
Admin	Platform & Management Overview	Provide an overall view of platform activity and product/store information	User activity, product catalogue, product categories, store/product availability, popular products, analytics summaries, data quality/status and important alerts
Mentor	Project & Analytics Overview	Provide a high-level view of project progress and analytics/ML outcomes	Project progress, analytics/ML results, data quality and refresh status, price/discount trends, customer insights/personas, issues and blockers

Stakeholder	Proposed Dashboard	Purpose	Key Information
Developer	Technical & System Overview	Help developers monitor the technical health and operation of DiscountMate	API/service health, errors/failures, system/API performance, data-processing status, backend–analytics integration, refresh status and technical issues

4. Customer Dashboard

Purpose

The existing DiscountMate dashboard is primarily customer-facing and supports product discovery and price comparison.

Required information

- Product search
- Product categories
- Product details
- Prices across Coles, Woolworths and IGA
- Savings/value indicators
- Product filters
- Favourites
- Product actions
- Product availability

Proposed views

- **Product Discovery**
- **Price Comparison**
- **Categories and Filters**
- **Savings / Best Value**
- **Saved/Favourite Products**

The existing dashboard already provides much of this functionality and therefore acts as the baseline for the stakeholder dashboard design.

5. Admin Dashboard

Purpose

The Admin dashboard provides administrators with a high-level overview of platform activity and the information required to manage the DiscountMate system.

Required information

- Total and active users
- Product catalogue information
- Product categories
- Store and product availability
- Popular products
- Platform activity
- Analytics summaries
- Data quality/status
- Important alerts

Proposed views

- **Platform Overview**
- **User Activity**
- **Product Catalogue**
- **Store & Price Analytics**
- **Analytics Summary**
- **System Alerts**

6. Mentor Dashboard

Purpose

The Mentor dashboard provides a concise overview of project progress and the outcomes of the analytics and machine-learning work.

Required information

- Overall project progress
- Main analytics/ML results

- Data quality status
- Data refresh status
- Price and discount trends
- Customer insights/personas
- Current issues
- Current blockers

Proposed views

- **Project Progress**
- **Analytics & ML Results**
- **Data Quality / Refresh Status**
- **Price & Discount Trends**
- **Customer Insights / Personas**
- **Issues & Blockers**

This view is intended to allow a mentor to quickly understand the current state of the project without needing to inspect individual technical components.

7. Developer Dashboard

Purpose

The Developer dashboard provides technical information required to monitor the health and operation of the DiscountMate system.

Required information

- API/service health
- API errors and failures
- System/API performance
- Data-processing status
- Backend–analytics service integration
- Data/service refresh status
- Current technical issues

Proposed views

- **System Health**
- **API Performance**
- **Errors & Failures**
- **Data Processing Status**
- **Service Integration**
- **Technical Issues**

This dashboard focuses on technical monitoring rather than customer or business-facing information.

8. Stakeholder-Specific Design Approach

The design of the dashboard proposed in this paper will be made following the stakeholders' specific way. It is possible that several dashboards may use the same DiscountMate database, but the information provided on those dashboards would be different depending on the stakeholder's interest.

For instance, the main interests of customers include product and price information. The main interests of the administrators include platform and catalogue information, while mentors need information about the project and the analysis results, and developers need technical information about the system and its services.

9. Team Review and Approval

The proposed stakeholder views were reviewed with team members. Feedback was specifically considered for the Mentor and Developer dashboards.

The Mentor dashboard requirements were agreed to include:

- Overall project progress
- Main analytics results
- Data quality/refresh status
- Price and discount trends
- Customer insights/personas
- Current issues and blockers

The Developer dashboard requirements were also reviewed, with technical monitoring areas such as API/service health, errors, performance, data-processing status and integrations considered appropriate.
